Design Document: Connecting Prototypes to Lecture Concepts and Client Requirements

Client: AIDS Program South Saskatchewan (apss)

Introduction:

This document will connect the design of High-Fidelity prototypes discussed for the AIDS Program South Saskatchewan (apss) with the learning concepts in ENSE 271 lectures and the Client needs.

With the analysis of client needs noted in Empathy map and brainstorming the design idea in group representing through Site Map, Lo-Fi Design prototypes and presenting this to client. After receiving the valuable feedback. We will show exactly how these Hi-Fi prototypes fix the clients problems with what we learned in the lectures.

Discussion of Lecture Concepts and Prototype Connections

(Bijay, Renzo, Juanna, Olexiy)

What we learn about Hi-Fi prototyping?

On this topic of interest, we learn Hi-Fi prototyping is the final, detailed approach where the design meets the standard for real website. Where it will look (Color & theme), function, operate for user experience and client needs.

After presenting our Lo-Fi design, Sitemap and StoryOnboard the Hi-Fi prototyping needs to meet the following needs: **Visually Engaging, Easy to Navigate, Good Color& theme choice, Fixed Problem for Broken Hotlinks**. To meet the Hi-Fi approach is people centred design, we followed our design ideas by linking to lecture concepts of **Affordances**, **Gestalt** and **Constraints.**

1. **Affordances**
   It is the **visual clues** that tell users **what actions they can take**. When meeting with the client, we found out they need easier way for users to find their research and resources. While they had asked for separated research site, as we are working on both main website and research section. We approach to connect it with homepage **navigation bar** that users have easy access. In between websites information and visual user can navigate to further information. For example: **Get involved button** in different pages based on connection

for donation, volunteering and careers choices, **Factsheets** hotlinks for further information through research. These aspects help for obvious and easy access to the user on how to search for information, do support, get regularly visited apss site without them having to guess what to do next.

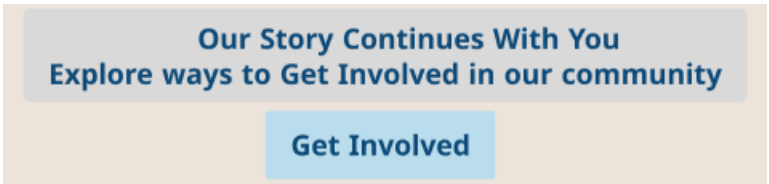

2. **Gestalt**
   It explains **how the human brain groups visual information together**. As the website had poor visual that was making it less engaging. Our Hi-fi prototypes show tons of pictures, pop up pictures titles that are links for later heavy word information. Rather than following the similar webpages style we divided each dropdown of navigation bar has visual beginning to later information gain. For example: Placing **bold dark text** for grouping, using **figure, rectangle, stars, line** to separate the information. These helped users to experience the important content pop out on brain and easier to read.

3. **Constraints**
   It is the way to **limit the user's options to prevent confusion and errors**. As apss main website contain 7 navigation bars with on average of 6 to 7 dropdown menu to separate different information on different pages. Our Hi-Fi design is design based on constraints that user can only make high level choices first to gain the information they want. For example: **Research on navigation bar** to directly connect the research for user. Each navigation bars only containing **4 to 5 dropdown menus** to get further information that group the flow to overall website. This prevents the users felling overwhelmed by too many options and stops them from **getting lost**, fixing **hard to navigate** issue of website.
