Project Background

The goal is to create a professional looking website that features research conducted by the AIDS Programs South Saskatchewan. The website will be designed to be user-friendly and easy to navigate so that users may be able to comfortably access publications, projects, and blog updates.

By designing a complementary research website to the APSS's main site, it will provide people additional opportunities to learn and further understand more about HIV/AIDS.

Customers

North Star:

Individuals personally affected by HIV/AIDS, who are seeking resources and support for their condition.

Carryover:

The general public. Comprised of people who are wanting to educate themselves about HIV/AIDS and are interested in supporting the APSS's cause.

Project Assumptions

The website will most likely be built using WordPress. We expect to create a site that focuses on clearly showing the research portion of the APSS's objective, while balancing out the heavy text with eye-catching graphics to keep the user engaged. Images will not be AI generated and may be chosen based on their relevancy and support of the research topic.

The layout of the site will also be organized to be more cohesive and easier to follow along. This may include implementing more drop down menus, working links, and topic specific pages.

Project Constraints

Possible constraints may include:

- Technical issues: Due to inexperience using WordPress and just building a website in general, we may come across technological issues such as assets not working properly or user errors. There is also a chance that we may deviate from the original plans in order to accommodate for unexpected design constraints with WordPress.
- Possible misleading information: Lack of time and feedback with the client may result in presenting inaccurate information and/or an unsatisfactory website layout.
- Scope: Possibly overestimating the workload and time needed for the project.
