Summarized Insights: Wordpress Model

This time around, our group attempted to achieve what the client was looking for while still adding our own changes. We were wanting to get their opinion of our interpretation in order to try to understand the client better.

One of our major topic points was the general navigation system. We kept all the pages that their current website has and compressed a lot of areas that had white spaces or those that had too much text. The way we decided to combat the extra white space in the original website was through formatting. We moved some images and textboxes around and also included an “accordion” feature on the HIV and HCV basics pages, where we kept the general definition of what the page was about and all additional information was kept under accordions. The addition of the accordion feature was to let the user decide for themselves what they wanted to read more into, and the client seemed like they liked this idea overall, so we will definitely be keeping it.

Another thing that we focused on was the general color scheme. It seems like the client did not seem too fond of the blue gradient we had last time so we ended up changing the color scheme of the website back to their original orange gradient. After talking with the client during our presentation they told us that they didn’t like gradients as a whole and would rather keep it one plain color, which we decided that we will pivot to for our final product. The client also mentioned that they didn’t like the fonts that we had on the website and advised us to stay away from serif fonts, which is another thing that we will be changing for our group's final project.

In our previous meeting, the client also talked about a blog page that they were interested in including on their website. We ended up including it this time, and this would give the client the ability to post about general messages to the people that visit their website. It would also have more research based findings posted as blogs for people to learn about, which they liked and and lead us to keeping it. We also ended up discussing a “quick exit” button, which would be a clickable button that would take the user straight out of the website to some random external page. We do not have this feature yet, but we will definitely be including it in our final product.

We also had a few plugins for general quality of life things, such as being able to move the order of the blog posts around with just clicking and dragging, and another plugin that allowed us to insert fillable forms, which any user and the APSS organization can see on the backend of the website. The client ended up saying that they did not want us to include the “HIV/STI Testing Form” page because of some possible data leaks, so we will definitely be removing that form. But other than that, the only other page that will have a form included is the contact form, which anyone can fill out if they have a question.

Lastly, one of our main critiques was based around our accessibility and formatting of the website itself, including things like text (including size, font, placement), images (including borders, formatting and accessibility with the text over image(s) and colors) and general

simplicity. The client noted that they preferred simple websites that get the job done, and with that in mind, we will try to simplify all the features that we currently have even further. We will make sure accessibility is provided to anyone who may have any inconvenience using the website, including people with sight issues, lack of technical expertise and so on.
